Falls cause brain injury!

According to the Centers for Disease Control and Prevention, “People age 75 and older have the highest rates of TBI-related hospitalization and death. In addition, they recover more slowly and die more often from these injuries than do younger people.” Falls are the greatest cause of brain injury in seniors (www.cdc.gov).

Prevent falls at home!

1. Create clear pathways.
2. Clear objects from floors & steps.
3. Remove or tape down loose rugs.
4. Do not walk over wires or cords.
5. Replace burned out light bulbs.
6. Replace loose or torn carpet.
7. Fix loose handrails on steps.
8. Use a tub mat or non-slip strips.
9. Install grab bars for tub, toilet.
10. Wear an alarm device to call help.

Keep yourself safe!

1. Review medications with your doctor or pharmacist to prevent drowsiness and dizziness.
2. See the doctor for every bump or blow if using blood thinners.
3. Consider exercise and strength training to decrease falls.
4. Keep vision appointments up to date to prevent falls.

What is a brain injury?

When an event is followed by changes in thinking, emotions, behavior or bodily functions, a brain injury has occurred. Traumatic Brain Injury comes from an outside force such as a blast, blow, fall, whiplash, impact or gunshot. Non-traumatic brain injury comes from a medical condition such as a stroke, diabetic coma, seizure, high fever, etc.

Typical changes

Thinking: Problems may affect memory, word finding, concentration, judgment, spatial awareness, conversation, organization, multi-tasking.

Emotions: Problems may involve anxiety, depression, mood swings, anger, impulsive behavior, agitation. Behavior: May ignore responsibilities and social cues. Difficulty considering others. Trouble starting and stopping.

Bodily functions: Seizures. Unsteady. Spastic muscles. Weakness. Paralysis. Blurred vision. Ringing in the ears. Slurred speech. Headache. Fatigue. Inability to wake up. Nausea. Vomiting. Dilation of one or both pupils. Sensitive to light, noise. Incontinence. Swallowing problems. Loss of smell and/or taste. Lack of coordination.

Get good care

Neuropsychologists provide evaluations and neuropsychiatrists manage medications. Many physicians are uninformed and may confuse brain injury with dementia.

Tips for recovery

1. Prevent further brain injuries.
2. Get plenty of rest & sleep.
3. Have water, fruits & veggies.
4. Address substance abuse.
5. Focus on personal interests daily.
6. Learn about brain injury.
7. Create a personal support circle.
8. Consider a support group.
9. Avoid drugs if possible.
10. Keep trying—accept errors.
11. Apply for the COMMCARE Waiver (1.877.550.4227) or the PA Head Injury Program (1.717.772.2762) to get home services, rehabilitation, home modifications, housing, etc.

More information

Go to www.cdc.gov to order these free brochures: “Preventing Traumatic Brain Injury in Older Adults” and “Check for Safety: A Home Fall Prevention Checklist for Older Adults”. Share this information with your friends and family.
